To Whom it May Concern,

In the spring of 2009, MPE Engineering accepted bids and information in regards to the rehabilitation of ten below-grade manhole structures that were experiencing moderate to high levels of groundwater infiltration in Redwood Meadows, west of Calgary. Previously, we had been in discussions with Derek Traquair of Martech who had presented infiltration control solutions using Prime Resins Polyurethane grouts as a infiltration prevention solution for these problems.

Derek provided us with the recommendation and contact information for Van Mason's Coatings as a company that had been certified by Prime Resins for injection grouting. After a site tour, Van Mason's was contracted to seal five of the leaking chambers from infiltration. After a review of the initial project, the contract was extended to include a total of ten chambers.

Van Mason's used a combination of Prime Resins Polyurathane Grout and Prime Resins Oakum. The techniques used by their personnel were also endorsed by Martech and Prime Resins. Furthermore, Derek Traquair came out personally to review the chambers that were undergoing maintenance by Van Mason's.

After the work was completed, it was observed that all ten chambers had been sealed properly, and there was no further infiltration due to groundwater leaking into the chamber. We have not experienced a high groundwater condition since the work was completed, but will be monitoring them on an ongoing basis. We also found that the project came in under budget, providing further value to MPE and Redwood meadows.

We appreciate and would like to thank Martech for their support in brining us this innovative solution and continue to work with Derek Traquair and Martech for our future projects.

Yours truly,

**MPE ENGINEERING LTD.**
